Research topics:

My research team aims to understand patterns and processes mediating function and evolution of marine biodiversity at the genetic level, from ecological to deep evolutionary scales. Topics include causes and consequences of variation in genetic biodiversity, population connectivity, environmental genomics and adaptive evolution, in the context of climate and environmental change. We study these across a diversity of marine systems that play important ecological roles in our planet, from microbial symbionts and polar plankton, to deep reefs and vents, kelp forests and seagrass meadows. We aim to contribute to conservation of marine ecosystems and societal awareness with projects directly aimed at marine habitat conservation and restoration, also fostering volunteer public participation and outreach of scientific information.
